BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a cDNA encoding delta-6 fatty acid desaturase from clone pps.pk0011.d5;fis isolated from Florida bitterbush developing seed cDNA library, pps. The delta-6 desaturase enzyme catalyses the formation of tariric acid, a fatty acid that has a triple bond at the delta-6 carbon. The present sequence is useful for producing transgenic plants having altered levels of delta-6 desaturase which in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polynucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is the gene encoding the borage (Borago officinalis) delta-6 desaturase enzyme. The lipid metabolism gene is an example of a heterologous gene which can be expressed at high levels in a seed-specific manner in transgenic plants, when placed under control of the sunflower albumin gene 5' regulatory region (AAV34397).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New sunflower albumin 5' regulatory region - useful for altered lipid metabolism in plant seeds  \label{eq:lipid}

                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes borage delta-6 desaturase (see
AAW98130), an enzyme that catalyses the conversion of linoleic acid
to gamma-linolenic acid (GLA). Delta-6 desaturase CDNA was
isolated from a borage membrane-bound polysomal cDNA library
using a partial clone, obtained from an EST database search, as
probe. The borage delta-6 desaturase nucleic acid can be
perably linked to the seed-specific 5' regulatory region (see
coperably linked to the seed-specific 5' regulatory region (see
AAX24916) of the Arabidopsis thaliana oleosin AtS21 gene in claimed
expression cassettes of the invention. Transgenic plants, e.g.
sunflower, soybean, maize, tobacco, cotton, peanut, oilseed
rape or Arabidopsis are obtained that show increased levels of
GIA or octadecatetraeonic acid. The levels of desirable fatty
coils of use in human health and industrial applications.

                                                                                                                                                                                                                                                                                                                                          A DNA clone (AAT30395) codes for borage delta-6-desaturase (AAR98455), which catalyses the conversion of linoleic acid to gamma-linolenic acid (GLA). It was isolated from a borage membrane-bound polysomal library using probes based on abundantly expressed sed storage protein CDNAs and with an isolated partial cDNA clone. The gene can be incorporated into a vector, pref. incorporating a tissue-specific promoter, for the expression of delta-6-desaturase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAT30395 standard;

                                                                                                          The invention describes an isolated nucleic acid encoding an evening primrose Delta6-desaturase. The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producing low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This sequence encodes the borage delta6 desaturase involved in the production of gamma linoleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-JAN-1992;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid encoding an evening primrose delta-6-desaturase polypeptide. The nucleic acid, a vector comprising the nucleic acid or a nucleic acid encoding delta-12-desaturase, is useful for producing a plant (such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of or producing low levels of GLA and for inducing production of or producing low levels of GLA and for inducing production of produces alpha-linolenic acid or a bacterium which a bacterium which delta-15-desaturase activity on a GLA substrate. This sequence represents cDNA encoding a borage delta-6-desaturase polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Local

```
Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -
```

The present sequence is a cDNA encoding sphingolipid desaturase from clone sel.pk0017.D4:fis isolated from soybean seedling cDNA library, sel. The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase whi in turn would alter the fatty acid composition. The enzyme is useful for producing polyclonal or monoclonal antibodies. The polynucleotide is also useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
